Asset Tracking App

- PAMS has native set of app for Android that allows you to use the software from your hand-held devices. The app set come with the PAMS ASSET module. Plus, the apps can work online or offline, so you don't need a constant Internet connection to get your work done.
- These apps make it easy for offsite and after-hours users to access the asset information they need.

Auditing

- Asset audits are essential for verifying what assets your organization owns and where they're located. They also help you enhance transparency and ensure your organization has accurate information for financial records.
- PAMS's auditing function provides a central register that records detailed information on all your organization's assets.
- With PAMS, you can link hand-held devices and scanners to your database to track each asset's location and status with minimal cost and resources. It works with mobile Android devices, and it allows you to do audits in both online and offline modes.

Audit Windows

- With PAMS's Audit Windows, the program administrator can set scheduled audit times for locations, receive status updates on the process, and set up notifications that let users know when the window will close. You're no longer limited to one specific day, nor do you have to be in audit mode to audit an asset.
- When a site is in the scheduled audit window, any asset action (move, check out, check in, or convert) will automatically be audited with no additional steps.
- The audit window gives you the flexibility you need for performing audits, works with your time parameters, and reduces the workload with its automated actions.

Blind Audit

- To add an extra level of security, PAMS allows you to select what asset information users can see when performing an audit. The blind audit feature, which works on mobile devices, provides users with hints about what type and number of assets they're auditing, but no further details. This limited information reduces the risk of not having all assets scanned.
- The blind audit feature can be especially helpful if you have a third-party performing your audits.

Audit Reconciliation

- With PAMS, an audit isn't final until you say it is. The audit reconciliation process enables you to do a final review of a site after an audit and make changes on assets that were marked as out of compliance.
- It's a great tool for removing assets that no longer exist but are still on the books and adding discovered assets that have not been recorded. If discrepancies are found, it's easy to do another audit of the site to check the data from the original audit.
- To help with transparency and accuracy, each transaction is recorded with a user, date and time stamp.

Barcode label/ NFC Asset tag

- PAMS has the built-in ability to create barcode labels (aka asset tags) via the software's templates or customized design option.
- You can manage your every phase of asset management– from barcoding assets when you first receive them to disposing assets when they're no longer usable – all within the same program

Check-In/Check-Out

- We've added a "quick find" feature that searches by asset, vendor, customer or employee and then populates the appropriate field for check-in/check-out. It can also populate these fields via a quick scan of the asset tag. This makes it easy to quickly check in and check-out multiple assets to multiple assignees in a single transaction.
- This feature is especially helpful for:
 - Tool cribs that regularly assign and collect a wide variety of tools from employees
 - Healthcare and emergency response units that must ensure their supplies of vital life-saving equipment are always maintained and available
 - Schools that pass out and receive student items such as band instruments, learning materials and athletic equipment

Dispose / Recover Assets

- Older asset management systems allowed for asset disposal of worn-out or missing assets, but the systems wreaked havoc if a lost item was later found.
- Users would often have to set the recovered asset up as a brand new item and manually include information about the asset's past. PAMS provides you with an easy way to recover these assets; it simply reactivates the old asset number and history.

Upload Assets

- PAMS's Upload feature is a guided step-by-step process that gets all your asset data into the PAMS software. The wizard lays out exactly how your spreadsheet should be ordered by category, imports the data, and sets it up in the appropriate PAMS fields.
- You can still use PAMS during the import process, and once the upload is completed, the software will send you a notification that lets you know the process is complete and identifies any import errors in the log.

Multi-Quantity Assets

- The multi-quantity feature sets PAMS apart from competitors; it gives you the flexibility to manage both fixed assets and quantity assets in one platform.
- We've added a new asset type, the multi-quantity asset, the enables you manage them under one asset number or ID. This option is helpful when an organization needs a fast and efficient way to track how many identical assets they have, but they're not interested in tracking each chair, desk, or keyboard as an individual item.
- This feature is especially helpful for Libraries. It makes tracking items like textbooks, instructional materials, and sports gear much easier. The multi-quantity feature makes it possible to quickly assign and recover these student items, and the system tracks who's received it and when it must be returned.

Role-Based Security

- Units can only access the element of its asset management system unless marked as Super role.
- PAMS has security settings that allow you to control the rights of the various users who will be working with the application.
- Role-based security provides a user access to specific data and applications based on their position. By creating "roles", you can set up access categories that define who has access rights to specific asset types, restrict what asset site locations they can view and edit, and set up data administration tools, reports, and modules.

Notifications

- PAMS keeps your team in the loop with its Email/SMS notifications. Sends out notifications about past due actions, asset use violations, audit checklists and more.
- The feature enables you to:
 - Have real-time event management that ensures follow-up and reduces the risk of delays and mistakes
 - Get rid of time consuming manual email and spreadsheet communication systems.
 - Store all communications

Reports

- PAMS has a large offering of standard reports such as
- Asset by Location,
- Audit History
- CheckIn/CheckOut
- and more

Screens

The screenshot displays the PAMS (Purple Arrow Management Studio) interface. The top navigation bar includes the PAMS logo, a user profile dropdown, a 'Logout' button, and an 'Edit Language Text' button. The main header shows the current date and time: 'Thursday, November 09 2017 7:39:03 PM' and the user's role: 'You are here: Administration'. The left sidebar contains a navigation menu with the following items: Administration, Attendance Processing, Company, Unit, Category, Department, Policy, Password Policy, Designation, Application Role, Assign Application Role, and Holidays. The main content area is titled 'Assets' and features a 'List' view. A search bar is present with a dropdown menu and a 'Search' button. Below the search bar is a 'New' button. The table below lists five assets:

	Asset Number	Asset Name	Asset Details	Unit Name	Asset Category
	1212	Laptop-Sony	SONY-Vaio-Laptop-SA26GG	Default	Laptop
	1234	Laptop-Dell	Dell-Inspiron-15-5558	Default	Laptop
	1443	Mobile-Sony	Sony Xperia XA1 Plus	Default	Mobile
	1563	Laptop-lenovo	Lenovo IdeaPad 320S	Default	Laptop
	2584	Mobile-Iphone		Default	Mobile

Other Specialized Applications

- File tracking
- Library management
- Hospital OT equipment management
- Service Management
- Conference Room Management
- Security Guard Tour Management
